

Stop burnout before it starts.

CalmCampus is a student wellness app. It helps students notice early signs that their wellbeing is slipping and take one small step. A minute a day, and all data stays on the phone.

iPhone app, Android to follow

KU Leuven pilot in preparation

How it works

- A one-minute daily check-in on mood, energy and stress. Every question can be skipped.
- Sleep and activity from Apple Health, compared with the student's own usual pattern.
- Short follow-up questions, only when they help make sense of the data.
- Pointers to student psychologists and 24/7 support lines.

Privacy by design

- Data stays on the phone. The current app has no server.
- No cloud AI, no analytics, no advertising identifiers.
- No account, name, email or location.
- A wellness tool. It does not diagnose or replace care.

1 in 3

KU Leuven freshmen reported a mental health problem in the past year (n = 4,921).

24.6%

of first-years would definitely seek help for an emotional problem.

3.3%

of mental health app users stay active after 30 days. Engagement is our big test.

Backed by research, honest about limits

We reviewed 35 studies and reports. The need is well documented. No study has tested CalmCampus itself, and effects of digital self-help in students are small. The pilot is designed to find out what works.

The road ahead

- **Now:** preparing the KU Leuven pilot
- **Next:** other universities in Belgium
- **Then:** the Netherlands
